

**DISPLAY METHOD AND APPARATUS FOR NAVIGATION SYSTEM FOR
PERFORMING CLUSTER SEARCH OF OBJECTS**

Abstract of the Disclosure

5 A method and apparatus for a navigation system conducts
a data search for finding relative density of objects such
as points of interest in a specified area and displays the
result of the search in various manners. The display method
includes the steps of: defining a size and shape of a search
10 template; scanning the search template on the search area by
displacing its position by a predetermined increment;
counting and recording a number of objects on the search area
within the search template at every increment of the
displacement position, thereby creating an object
15 distribution matrix; applying a cluster search algorithm to
the object distribution matrix, thereby detecting
distribution of clusters of the objects; and displaying the
clusters of the objects in the search area.
